Arya Gavali

aryapgavali@gmail.com

Summary

Full Stack Developer (fresher) with hands-on experience building web applications using Java, Spring Boot, and React.js. I enjoy working across the stack — from designing REST APIs to building clean UIs — and I'm looking for a role where I can keep learning and contribute from day one.

Education

Degree	Specialisation	Institution / Board	Year	Score
M.Sc.	Scientific Computing	Savitribai Phule Pune University	Pursuing	—
B.Sc.	Computer Science	Savitribai Phule Pune University	2022 – 2025	CGPA: 6.23
HSC (12th)	General Science	Maharashtra State Board	2022	54.67%
SSC (10th)	—	Maharashtra State Board	2020	89.40%

Technical Skills

Programming Languages: Java | C++ | C

Web Technologies: HTML5 | CSS3 | React.js

Backend Framework: Spring Boot | REST API | MVC Architecture

Database: MySQL (Schema Design, Querying, Joins, Indexing)

Core CS Concepts: Data Structures | OOP | SDLC | System Design (Basic)

Version Control: Git | GitHub

Tools & IDEs: IntelliJ IDEA | VS Code | Postman | MySQL Workbench

Operating Systems: Windows | Linux (Ubuntu)

Projects

Online Queue Management System

Duration: Aug 2025 – May 2026 | Tech Stack: React.js, Spring Boot, MySQL, REST API

A full stack web application designed to digitise and streamline queue management for high-footfall services such as hospitals, banks, government offices, and hotels. The system eliminates physical queuing by issuing virtual tokens to users and providing live queue status. It features a React.js frontend for an intuitive user experience and a Spring Boot backend exposing RESTful APIs. MySQL is used to persist token records, service counters, and queue state. The application significantly reduces wait times and improves service throughput by automating queue progression.

- Designed and developed 8+ RESTful APIs in Spring Boot following MVC architecture for token generation, counter management, and real-time queue status updates.
- Built a responsive React.js frontend with a live token dashboard, reducing average user wait-time visibility lag to under 2 seconds.
- Designed a normalised MySQL database schema across 5+ tables covering token lifecycle, service counters, and user sessions, ensuring data consistency under concurrent access.
- Integrated frontend with backend APIs and performed end-to-end API testing using Postman, catching and resolving 10+ integration bugs before deployment.
- Followed SDLC practices — contributing to sprint planning, feature scoping, and peer code reviews — across a 10-month agile development cycle with a 3-member team.

Numerical Computing Library

Duration: Jan 2026 – Nov 2026 | Tech Stack: C++, OOP, STL

A C++ library built to handle common linear algebra and numerical computing tasks. It grew out of coursework for the M.Sc. in Scientific Computing and covers matrix operations, solving systems of equations, and related algorithms. The code is structured using OOP so each component is self-contained and easy to extend. The goal was to have a reliable, reusable toolkit rather than rewriting the same logic repeatedly across different problems.

- Architected the full library using OOP principles in C++, organising 10+ reusable classes across linear algebra and matrix operation modules.
- Implemented Gaussian Elimination and LU Decomposition algorithms, achieving correct solutions for systems of up to 10 equations verified against known results.
- Developed 6+ matrix operation utilities (multiplication, transposition, determinant, inverse) as standalone, unit-tested components.
- Achieved 90%+ test pass rate across all modules through systematic unit testing against mathematical reference outputs.
- Documented the full API with usage examples, reducing onboarding time for future academic users by providing a clear and structured reference.
